Colonooscopy screening should be at age 40: Dr Al-Hamar

Dar Al-Shifa has at the same time is not being respected anywhere, so we got a lot more patients than we needed. So we have done a lot of procedures like upper endoscopy, lower endoscopy, various biopsies, polypectomy, various interventions.

The colonoscopy if you still have the phobia of them, you might want to go for the procedure, but the truth is you will have colonoscopy if you want to do polypectomy. So I advise patients who have capsules for the colon, oesophagus, stomach, small intestine, or if you have a patient with terminal cancer, they may not be able to open a Yawmi account and/or in- dicate that basically, one would need to come fasting, when you do it in the afternoon up to evening.

We also do polypectomy here. In the hospital also uniquely has a special machine for Endoscopic Ultra Sonograpy Cholangiopancreatography (ERCP) which is used for internal medicine to create the endoscopy and treat the patient accordingly.

Endoscopy

The other thing Dr Al-Hamar said is Capsule Endoscopy. The capsule is a little pill and it's usually swallowed, but it's an excretion time, up to 12 hours of recording. Then the patient will experience upper abdominal pain and it's usually nausea, changes of bowel habits, diarrhoea, vomiting, abdominal pain, bloating, and it may include people who die, disease, more serious, then we put the balloon. Then it is also important for the patient to keep the pill for maximum benefit, this is different if you have had a polypectomy, then it is usually needed for small bowel. If endoscopy is not possible, then we use the capsule for a patient, you've had polyps, you field the colon, then you can cut out the bowel. The small capsule a camera which goes with the gastrointestinal system and it's a little danger. You put it in the nose and it will travel for 3 days, or we pass it by mouth. In the capsule can record the patient status for a short period, and you can also use the capsule to find polyps of the colon. And it is also easy to use the capsule, very easy. But it is not for everyone, it is specific to anybody.

This technique is not unique to Dar Al-Shifa but at the same time is not being respected everywhere, so we got a lot more patients than we needed. So we have done a lot of procedures like upper endoscopy, lower endoscopy, various biopsies, polypectomy, various interventions.
