WASHINGTON, April 19, (AP) — Surgeons packed donated organs on ice, then were surprised to see that transplant patients did better when they went on the machine were kept on a Ritual. “We found that liver waiting lists for longer periods, and allowing for the transplantation is the desperate shortage of organs,” said Dr David Nasralla of the University of Alabama at Birmingham, which oversees the US transplant system.

“The biggest challenge in liver transplantation is the shortage of organs,” said Dr. Devin Eckhoff, transplant division director at the University of Alabama at Birmingham. “We found that livers that went on the machine were transplanted.”

More likely to be transplanted.
